Poison Dart Frogs

By Sheri Skelton

Poison dart frogs are tiny, colorful frogs. They live in the rain forests in Central and South America. Poison dart frogs are also called arrow-poison frogs, poison arrow frogs, or dart frogs.

Poison dart frogs have some unusual habits. Most frogs are nocturnal, or active at night. Poison dart frogs are diurnal, or active during the day. They are also very involved parents. The mother frogs lay their eggs on leaves. When the eggs hatch, the father frogs carry the young tadpoles on their backs to puddles of water. The water could be in bromeliads, plants that hold little pockets of water. Sometimes the mother poison dart frogs lay eggs in the water.

Poison dart frogs could be easy prey for predators. However, the frogs have a secret weapon. They contain a deadly poison. They secrete the poison through glands in their skin. This makes even licking a poison dart frog a potentially deadly action for a predator. Some South American indigenous people dip the tips of their arrows in poison taken from the frogs. This makes an effective hunting weapon.

Poison dart frogs do warn their predators to keep away. The bright colors of the frogs tell predators that these frogs won't make a good meal. The two-toned arrow-poison frog is brick red in color. This frog also has patches of dark blue on its legs. The three-striped arrow-poison frog is yellow with black stripes. Some poison dart frogs have flash colors. When the frog jumps, its brilliant colors flash. This flashing of colors is a warning signal. Look, but don't touch!
